Ultra Large Scale DNA Sequence Analysis Michael Schatz

November 23, 2010 CSHL In-House Symposium XXIV

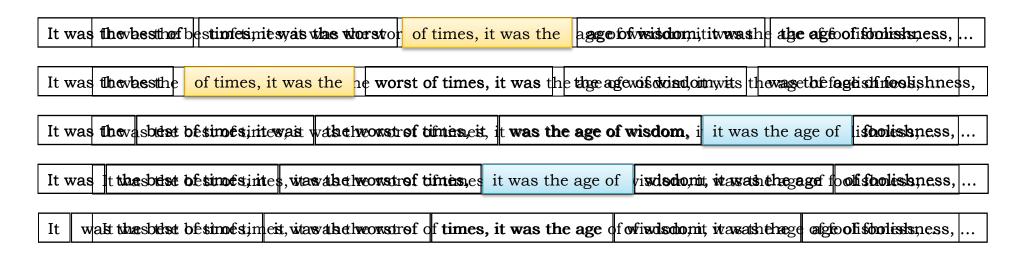

Outline

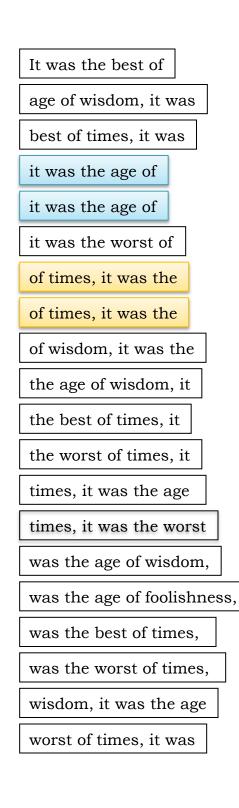

- I. Genome Assembly by Analogy
- 2. DNA Sequencing and Genomics
- 3. Sequence Analysis Projects
 - I. Mapping & Genotyping
 - 2. Microsatellite Profiling
 - 3. De novo assembly

Shredded Book Reconstruction

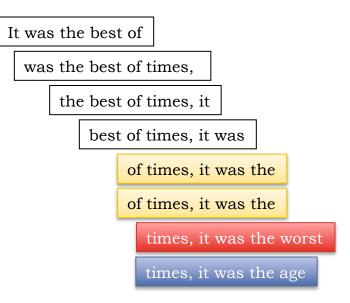

Dickens accidentally shreds the first printing of <u>A Tale of Two Cities</u>
 – Text printed on 5 long spools

- How can he reconstruct the text?
 - 5 copies x 138, 656 words / 5 words per fragment = 138k fragments
 - The short fragments from every copy are mixed together
 - Some fragments are identical

Greedy Reconstruction

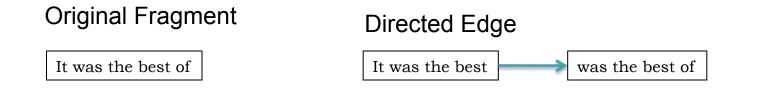

The repeated sequence make the correct reconstruction ambiguous

• It was the best of times, it was the [worst/age]

Model sequence reconstruction as a graph problem.

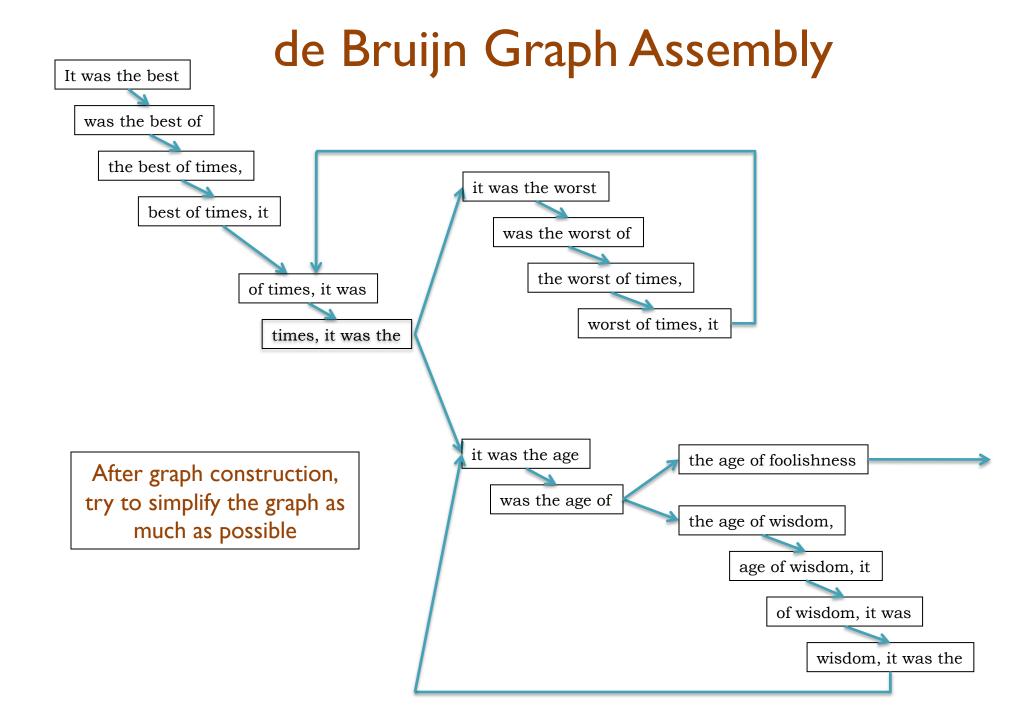

de Bruijn Graph Construction

- $D_k = (V, E)$
 - V = All length-k subfragments (k < l)
 - E = Directed edges between consecutive subfragments
 - Nodes overlap by k-1 words

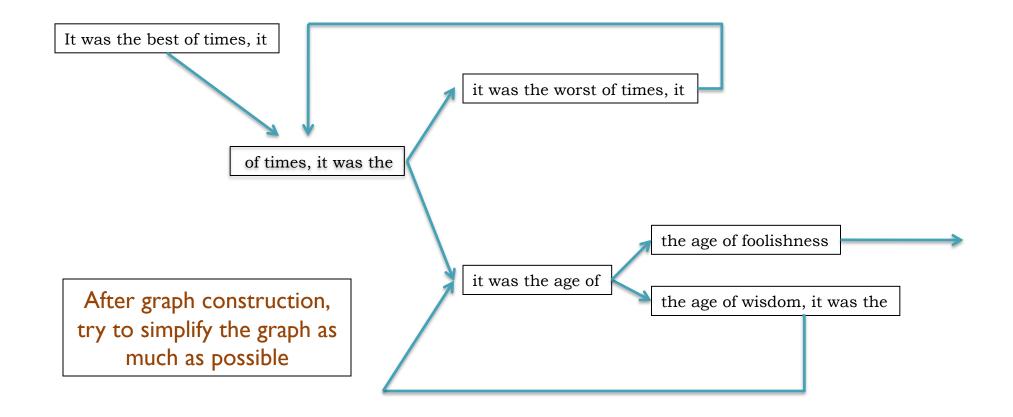

- Locally constructed graph reveals the global sequence structure
 - Overlaps between sequences implicitly computed

de Bruijn, 1946 Idury and Waterman, 1995 Pevzner, Tang, Waterman, 2001

de Bruijn Graph Assembly

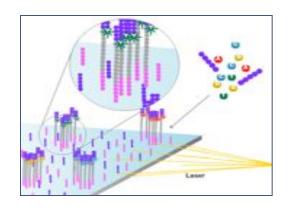

Genomics & DNA Sequencing

Genome of an organism encodes the genetic information in long sequence of 4 DNA nucleotides: ACGT

- Bacteria: ~3 million bp
- Humans: ~3 billion bp

Current DNA sequencing machines can sequence millions of short (25-500bp) reads from random positions of the genome

- Per-base error rate estimated at 1-2% (Simpson et al, 2009)

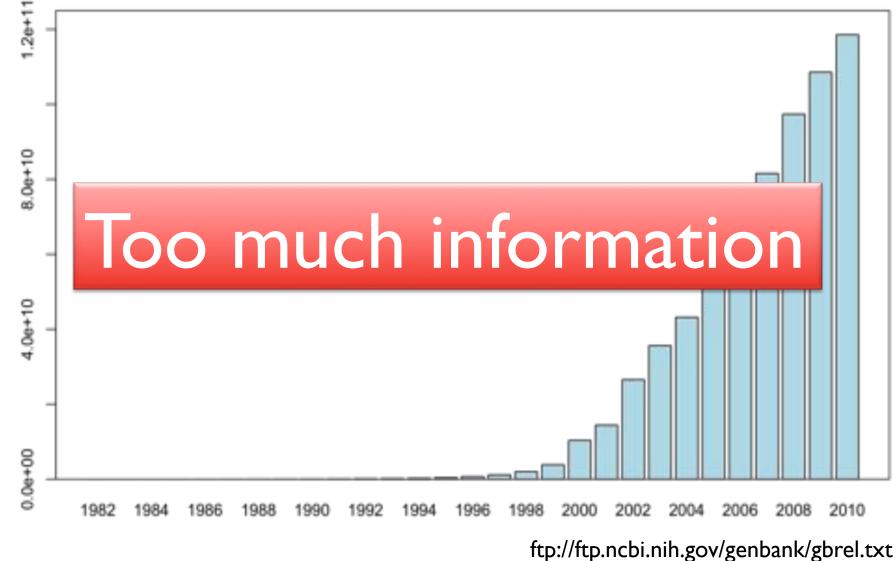

GGAGTTAGTAAAAGTCCACATTGAG

Like Dickens, we can only sequence small fragments of the genome at once.

- A single human genome requires ~100 GB of raw data
- We need extremely scalable systems and algorithms

The DNA Deluge

Exponential Growth of GenBank Dec 1982 - Oct 2010

base pairs

Hadoop MapReduce

http://hadoop.apache.org

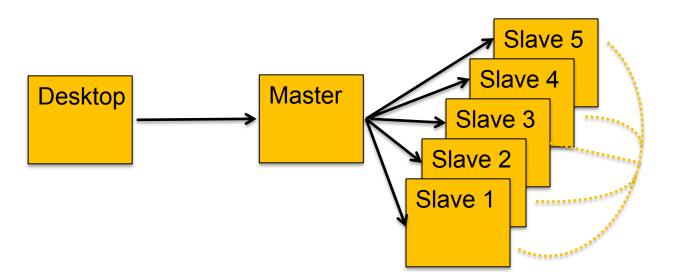

- MapReduce is Google's framework for large data computations
 - Data and computations are spread over thousands of computers
 - Indexing the Internet, PageRank, Machine Learning, etc... (Dean and Ghemawat, 2004)
 - 946,460 TB processed in May 2010 (Jeff Dean at Stanford, 11.10.2010)
 - Hadoop is the leading open source implementation
 - Developed and used by Yahoo, Facebook, Twitter, Amazon, etc
 - GATK is an alternative implementation specifically for NGS
 - Benefits
 - Scalable, Efficient, Reliable
 - Easy to Program
 - Runs on commodity computers

- Challenges
 - Redesigning / Retooling applications
 - Not Condor, Not MPI
 - Everything in MapReduce

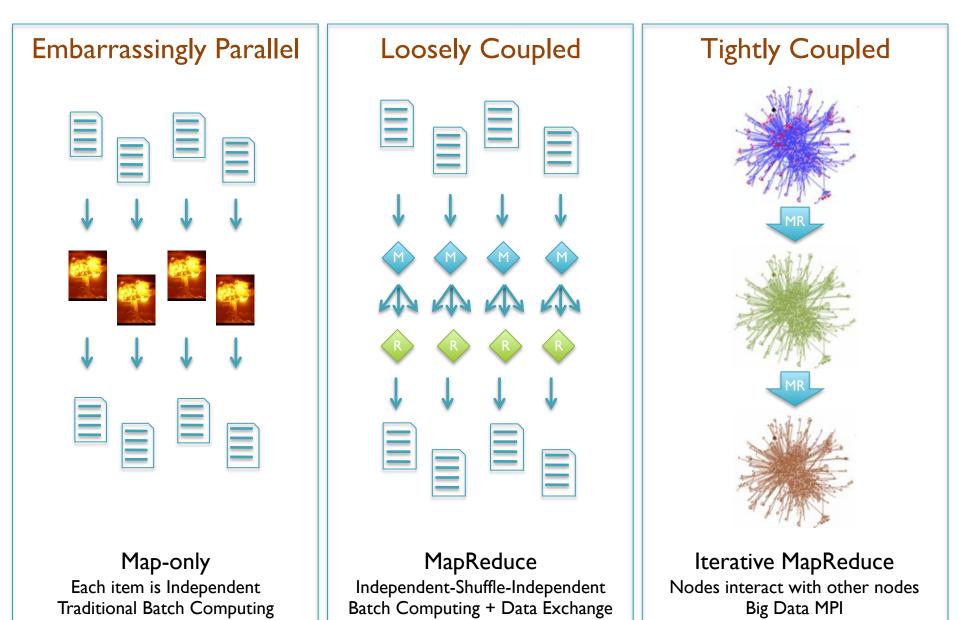

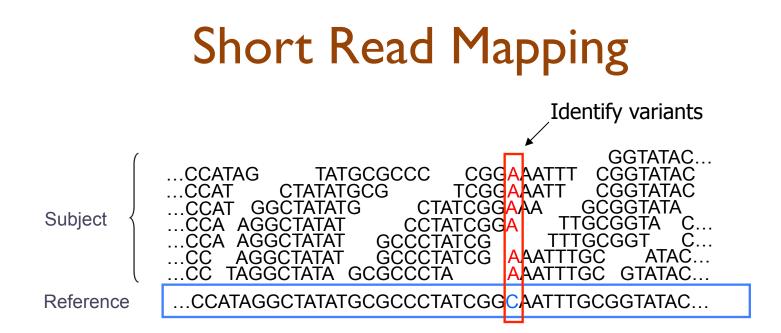

System Architecture

- Hadoop Distributed File System (HDFS)
 - Data files partitioned into large chunks (64MB), replicated on multiple nodes
 - Computation moves to the data, rack-aware scheduling
- Hadoop MapReduce system won the 2009 GreySort Challenge
 - Sorted 100 TB in 173 min (578 GB/min) using 3452 nodes and 4x3452 disks

Programming Models

• Given a reference and many subject reads, report one or more "good" end-toend alignments per alignable read

Methyl-Seq

Hi-C-Seq

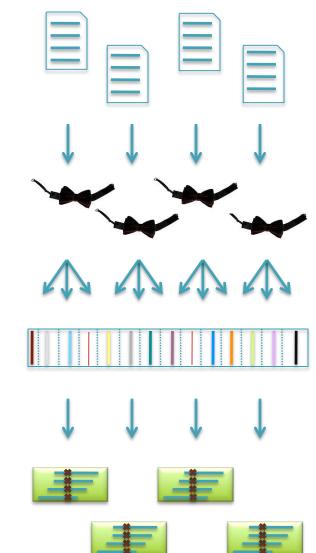

- Find where the read most likely originated
- Fundamental computation for many assays
 - Genotyping
 RNA-Seq
 - Structural Variations Chip-Seq
- Desperate need for scalable solutions
 - Single human requires >1,000 CPU hours / genome

http://bowtie-bio.sourceforge.net/crossbow

- Align billions of reads and find SNPs
 - Reuse software components: Hadoop Streaming
- Map: Bowtie (Langmead et al., 2009)
 - Find best alignment for each read
 - Emit (chromosome region, alignment)
- Shuffle: Hadoop
 - Group and sort alignments by region
- Reduce: SOAPsnp (Li et al., 2009)
 - Scan alignments for divergent columns
 - Accounts for sequencing error, known SNPs

Performance in Amazon EC2

http://bowtie-bio.sourceforge.net/crossbow

	Asian Individual Genome		
Data Loading	3.3 B reads	106.5 GB	\$10.65
Data Transfer	lh :15m	40 cores	\$3.40
Setup	0h : 15m	320 cores	\$13.94
Alignment	1h : 30m	320 cores	\$41.82
Variant Calling	I h : 00m	320 cores	\$27.88
End-to-end	4h : 00m		\$97.69

Analyze an entire human genome for ~\$100 in an afternoon. Accuracy validated at >99%

Searching for SNPs with Cloud Computing.

Langmead B, Schatz MC, Lin J, Pop M, Salzberg SL (2009) Genome Biology. 10:R134

Hadoop for NGS Analysis

Quality-aware error correction of short reads

CloudBurst

Highly Sensitive Short Read Mapping with MapReduce

> 100x speedup mapping on 96 cores @ Amazon

SeqMS: NextGen Microsatellite Profiling

Mitchell Bekritsky, WSBS

- Class of simple sequence repeats
 - $\dots GCACACACACAT \dots = \dots G(CA)_5T \dots$
 - Created and mutate primarily through slippage during replication
 - Highly variable & ubiquitous
- Genotyping with SeqMS
 - Rapidly detect MS sequences
 - Map reads using a new MS-mapper
 - Analyze profiles in cells, across cells, & across populations
 - Loss of heterozygosity
 - Development of somatic & cancer cells
 - Relations across strains, across species
 - etc...

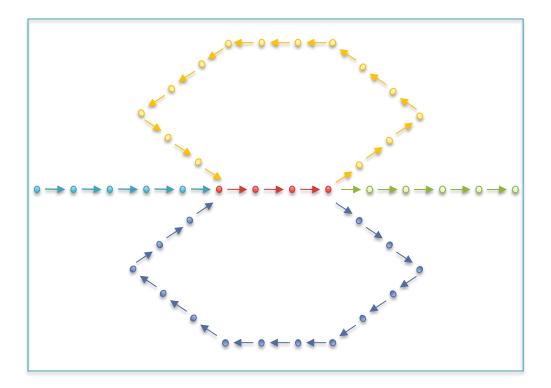

Short Read Assembly

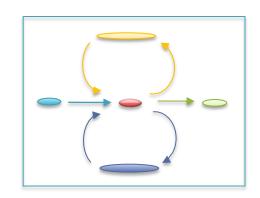

- Genome assembly as finding an Eulerian tour of the de Bruijn graph
 - Human genome: >3B nodes, >10B edges
- The new short read assemblers require tremendous computation
 - Velvet (Zerbino & Birney, 2008) serial: > 2TB of RAM
 - ABySS (Simpson et al., 2009) MPI: 168 cores x ~96 hours
 - SOAPdenovo (Li et al., 2010) pthreads: 40 cores x 40 hours, >140 GB RAM

Graph Compression

- After construction, many edges are unambiguous
 - Merge together compressible nodes
 - Graph randomly distributed over hundreds of computers

Design Patterns for Efficient Graph Algorithms in MapReduce.

Lin, J, Schatz, MC (2010) Workshop on Mining and Learning with Graphs Workshop (KDD/MLG-2010)

Fast Path Compression

Challenges

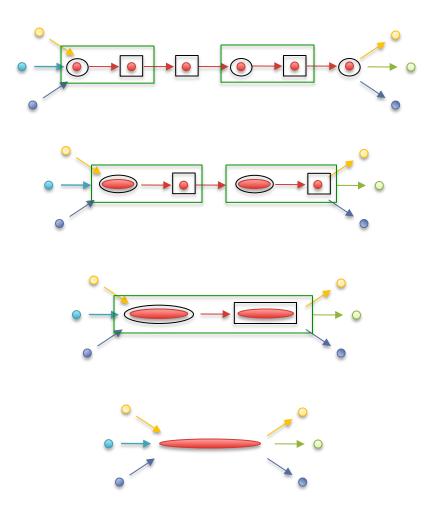

- Nodes stored on different computers
- Nodes can only access direct neighbors

Randomized List Ranking

- Randomly assign (H)/T to each compressible node
- Compress $(H) \rightarrow T$ links

Performance

- Compress all chains in log(S) rounds
- <30 rounds for human genome</p>

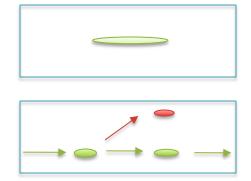

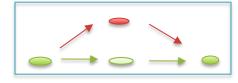

Randomized Speed-ups in Parallel Computation.

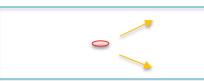

Vishkin U. (1984) ACM Symposium on Theory of Computation. 230-239.

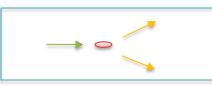

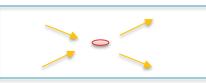

Node Types

Isolated nodes (10%)

Tips (46%)

Bubbles/Non-branch (9%)

Dead Ends (.2%)

Half Branch (25%)

Full Branch (10%)

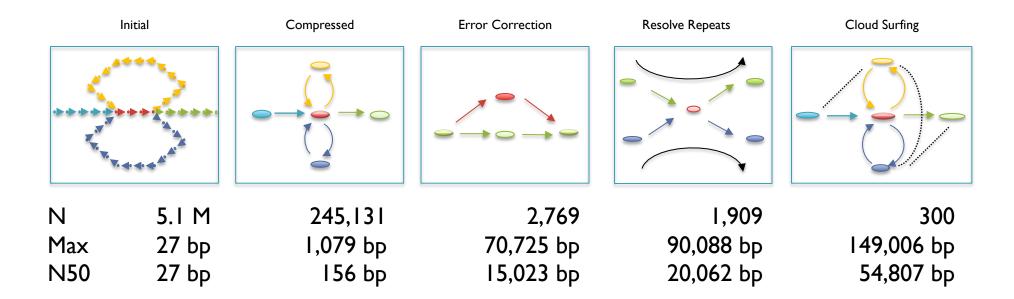

(Chaisson, 2009)

Contrail

http://contrail-bio.sourceforge.net

De novo bacterial assembly

- Genome: E. coli K12 MG1655, 4.6Mbp
- Input: 20.8M 36bp reads, 200bp insert (~150x coverage)
- Preprocessor: Quake Error Correction

Assembly of Large Genomes with Cloud Computing.

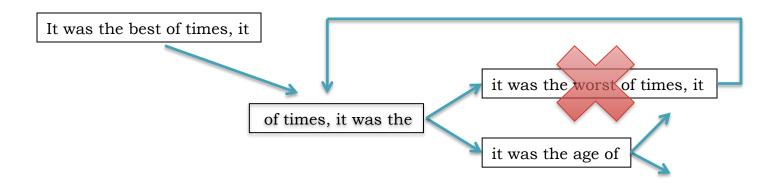

Schatz MC, Sommer D, Kelley D, Pop M, et al. In Preparation.

E. coli Assembly Quality

Incorrect contigs: Align at < 95% identity or < 95% of their length

Assembler	Contigs ≥ 100bp	N50 (bp)	Incorrect contigs
Contrail PE	300	54,807	4
Contrail SE	529	20,062	0
SOAPdenovo PE	182	89,000	5
ABySS PE	233	45,362	13
Velvet PE	286	54,459	9
EULER-SR PE	216	57,497	26
SSAKE SE	931	11,450	38
Edena SE	680	16,430	6

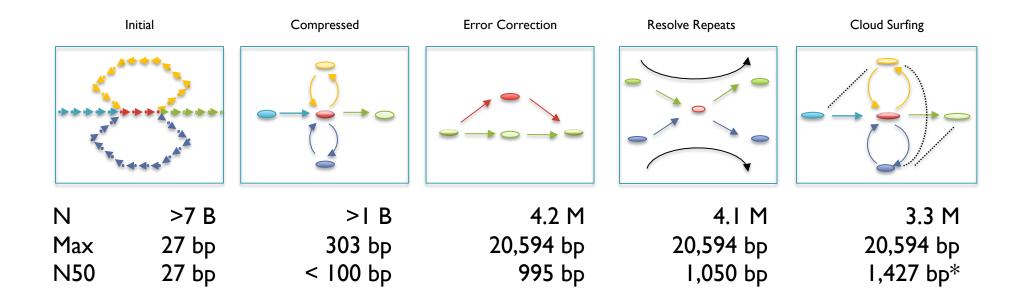

Contrail http://contrail-bio.sourceforge.net

De novo assembly of the Human Genome

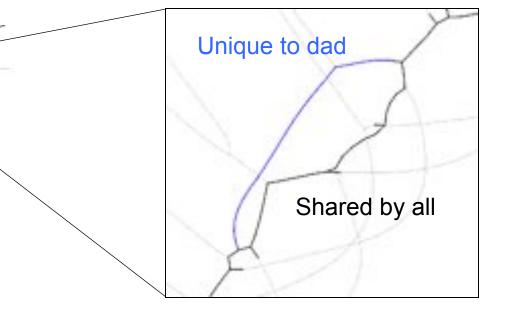

- Genome: African male NA18507 (SRA000271, Bentley et al., 2008)
- Input: 3.5B 36bp reads, 210bp insert (~40x coverage)

Assembly of Large Genomes with Cloud Computing.

Schatz MC, Sommer D, Kelley D, Pop M, et al. In Preparation.

Variations and de Bruijn Graphs

Searching for de novo mutations in the families of 3000 autistic children.

- Assemble together reads from mom, dad, affected & unaffected children
- Look for sequence paths unique to affected child

MRCILI

Summary

- Staying afloat in the data deluge means computing in parallel
 - Hadoop + Cloud computing is an attractive platform for large scale sequence analysis and computation
- Significant obstacles ahead
 - Price
 - Transfer time
 - Privacy / security requirements
 - Time and expertise required for development (Schatz et al., Nature Biotechnology, 2010)
- Emerging technologies are a great start, but we need continued research
 - A word of caution: new technologies are new

Counting Eulerian Tours $A \xrightarrow{B} B \xrightarrow{R} D$ $A \xrightarrow{R} B \xrightarrow{R} D \xrightarrow{R} B \xrightarrow{R} C \xrightarrow{R} D \xrightarrow{R} B \xrightarrow{R} C \xrightarrow{R} D \xrightarrow{R} D \xrightarrow{R} B \xrightarrow{R} C \xrightarrow{R} D \xrightarrow{R} D \xrightarrow{R} B \xrightarrow{R} D \xrightarrow{R} B \xrightarrow{R} D \xrightarrow{R} B \xrightarrow{R} B \xrightarrow{R} D \xrightarrow{R} B \xrightarrow{R$

Often an astronomical number of possible assemblies

- Value computed by application of the BEST theorem (Hutchinson, 1975)

$$\mathcal{W}(G,t) = (\det L) \left\{ \prod_{u \in V} (r_u - 1)! \right\} \left\{ \prod_{(u,v) \in E} a_{uv}! \right\}^{-1}$$

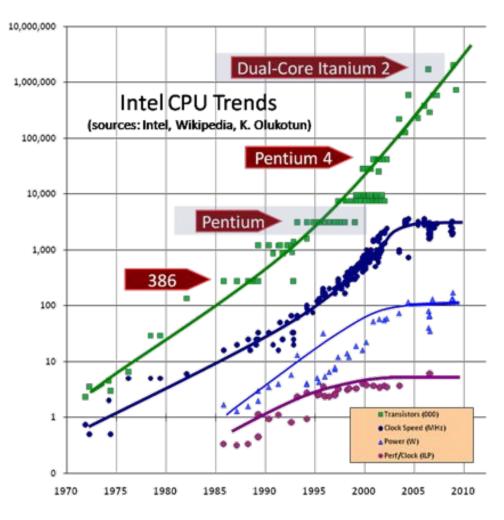

L = n x n matrix with r_u - a_{uu} along the diagonal and $-a_{uv}$ in entry uv
 $r_u = d^+(u) + l$ if $u = t$, or $d^+(u)$ otherwise
 a_{uv} = multiplicity of edge from u to v

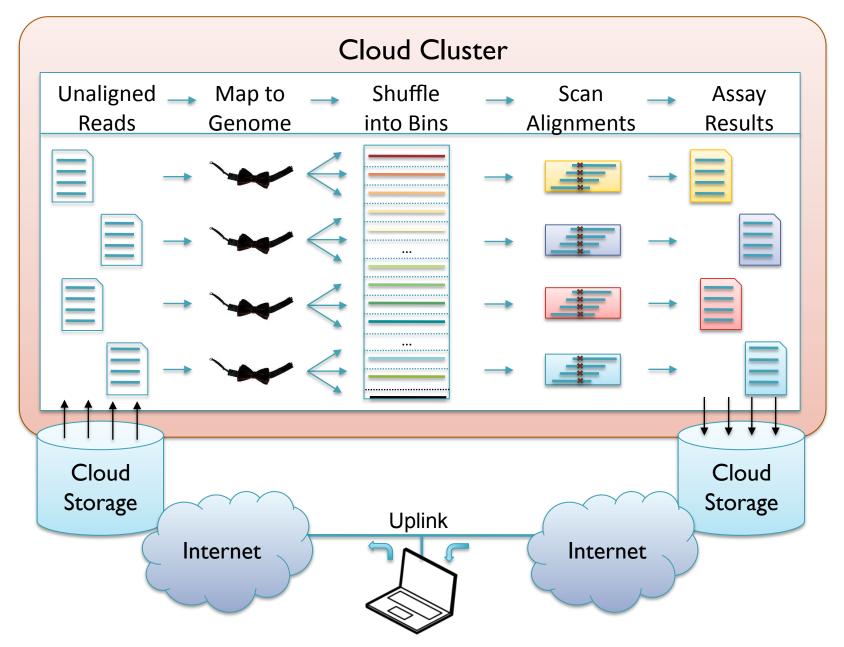

Assembly Complexity of Prokaryotic Genomes using Short Reads. Kingsford C, Schatz MC, Pop M (2010) *BMC Bioinformatics*.

Why HPC?

- Moore's Law is valid in 2010
 - But CPU speed is flat
 - Vendors adopting parallel solutions instead
- Parallel Environments
 - Many cores, including GPUs
 - Many computers
 - Many disks
- Why parallel
 - Need results faster
 - Doesn't fit on one machine

Cloud Computing and the DNA Data Race. Schatz, MC, Langmead, B, Salzberg SL (2010) *Nature Biotechnology*. 28: 691–693
