

Exact Matching & CS Fundamentals

Michael Schatz

Bioinformatics Lecture I
Quantitative Biology 2011

Computer Science & Computational Biology

"Computer science is no more about computers than astronomy is about telescopes."
Edsger Dijkstra

- **Computer Science = Science of Computation**
 - Solving problems, designing & building systems
 - Thinking recursively about data, across levels of abstraction
 - Reasoning that your methods are fast & correct
- **Computer Science >> Computer Programming**
 - Computers are very, very dumb, but we can instruct them
 - Build complex systems out of simple components
 - They will perfectly & repeatedly execute instructions forever
- **CompBio = Thinking Computationally about Biology**
 - Processing: Make more powerful instruments, analyze results
 - Designing & Understanding: protocols, procedures, systems

Sequence Alignment

- A very common problem in computational biology is to find occurrences of one sequence in another sequence
 - Genome Assembly
 - Gene Finding
 - Comparative Genomics
 - Functional analysis of proteins
 - Motif discovery
 - SNP analysis
 - Phylogenetic analysis
 - Primer Design
 - Personal Genomics
 - ...

Exact Matching Overview

Where is GATTACA in the human genome?

Searching for GATTACA

- Where is GATTACA in the human genome?
- Strategy I: Brute Force

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	...
T	G	A	T	T	A	C	A	G	A	T	T	A	C	C	...
G	A	T	T	A	C	A									

No match at offset 1

Searching for GATTACA

- Where is GATTACA in the human genome?
- Strategy 1: Brute Force

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	...
T	G	A	T	T	A	C	A	G	A	T	T	A	C	C	...
	G	A	T	T	A	C	A								

Match at offset 2

Searching for GATTACA

- Where is GATTACA in the human genome?
- Strategy I: Brute Force

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	...
T	G	A	T	T	A	C	A	G	A	T	T	A	C	C	...
		G	A	T	T	A	C	A	...						

No match at offset 3...

Searching for GATTACA

- Where is GATTACA in the human genome?
- Strategy I: Brute Force

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	...
T	G	A	T	T	A	C	A	G	A	T	T	A	C	C	...
								G	A	T	T	A	C	A	

No match at offset 9 <- Checking each possible position takes time

Brute Force Analysis

- Brute Force:
 - At every possible offset in the genome:
 - Do all of the characters of the query match?
- Analysis
 - Simple, easy to understand
 - Genome length = n [3B]
 - Query length = m [7]
 - Comparisons: $(n-m+1) * m$ [21B]
- Overall runtime: $O(nm)$
 - If we double genome or query size, takes twice as long
 - If we double both, takes 4 times as long

Brute Force in Matlab

```
query = 'GATTACA';
genome = 'TGATTACAGATTACC';

nummatches=0;

% At every possible offset
for offset=1:length(genome)-length(query)+1
    % Do all of the characters match?
    if (genome(offset:offset+length(query)-1) == query)
        disp(['Match at offset ', num2str(offset)])
        nummatches = nummatches+1;
    else
        %Uncomment to see every non-match
        %disp(['No match at offset ', num2str(offset)])
    end
end

disp(['Found ', num2str(nummatches), ' matches of ', query, ' in genome of length ',
    num2str(length(genome))])

disp(['Expected number of occurrences: ', num2str((length(genome)-length(query)+1)/
    (4^length(query))])])
```

Expected Occurrences

The expected number of occurrences (e-value) of a given sequence in a genome depends on the length of the genome and inversely on the length of the sequence

- 1 in 4 bases are G, 1 in 16 positions are GA, 1 in 64 positions are GAT
- 1 in 16,384 should be GATTACA
- $E = (n - m + 1) / (4^m)$

[183,105 expected occurrences]

Value and sequence length
cutoff 0.1

E-value and sequence length
cutoff 0.1

[Challenge Question: What is the expected distribution & variance?]

Brute Force Reflections

Why check every position?

- GATTACA can't start at position 15

[WHY?]

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	...
T	G	A	T	T	A	C	A	G	A	T	T	A	C	C	...
								G	A	T	T	A	C	A	

- Improve runtime to $O(n + m)$

[3B + 7]

- If we double both, it just takes twice as long
- Knuth-Morris-Pratt, 1977
- Boyer-Moyer, 1977, 1991

- For one-off scans, this is the best we can do (optimal performance)

- We have to read every character of the genome, and every character of the query
- For short queries, runtime is dominated by the length of the genome

Searching the Index

- Strategy 2: Binary search
 - Compare to the middle, refine as higher or lower

Binary Search Analysis

- Binary Search

Initialize search range to entire list

$mid = (hi+lo)/2$; $middle = suffix[mid]$

if query matches middle: done

else if query < middle: pick low range

else if query > middle: pick hi range

Repeat until done or empty range

[WHEN?]

- Analysis

- More complicated method

- How many times do we repeat?

- How many times can it cut the range in half?

- Find smallest x such that: $n/(2^x) \leq 1$; $x = \lg_2(n)$

[32]

- Total Runtime: $O(m \lg n)$

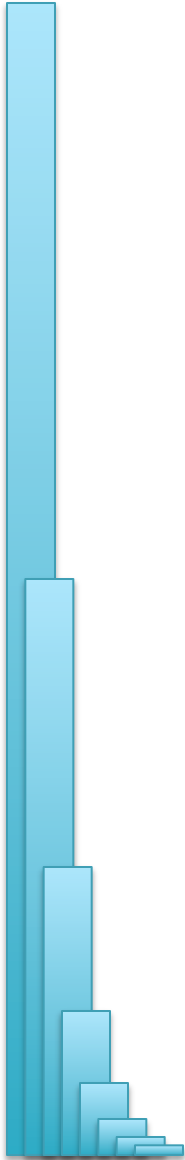

- More complicated, but **much** faster!

- Looking up a query loops 32 times instead of 3B

[How long does it take to search 6B nucleotides?]

Binary Search in Matlab

```
%% create our sorted list of 100 numbers
seq=1:100;
query=33;

%% initialize search range
lo=1;
hi=length(seq);
steps=0;

%% search
while (lo<=hi)
    steps = steps+1;
    mid=floor((lo+hi)/2);
    middle=seq(mid);
    disp(['Step ', num2str(steps), ' checking seq[' , num2str(mid), ']=' , num2str(middle)])
    if (query == middle)
        disp(['Found at ', num2str(mid), ' in ', num2str(steps), ' steps'])
        break
    elseif (query < middle)
        disp(['less than ', num2str(middle)])
        hi=mid-1;
    else
        disp(['greater than ', num2str(middle)])
        lo=mid+1;
    end
end
end
```

Suffix Array Construction

- How can we store the suffix array?
[How many characters are in all suffixes combined?]

$$S = 1 + 2 + 3 + \dots + n = \sum_{i=1}^n i = \frac{n(n+1)}{2} = O(n^2)$$

- Hopeless to explicitly store 4.5 billion billion characters
- Instead use implicit representation
 - Keep 1 copy of the genome, and a list of sorted offsets
 - Storing 3 billion offsets fits on a server (12GB)
- Searching the array is very fast, but it takes time to construct
 - This time will be amortized over many, many searches
 - Run it once "overnight" and save it away for all future queries

Sorting

Sort these numbers into ascending order:

14, 29, 6, 31, 39, 64, 78, 50, 13, 63, 61, 19

[How do you do it?]

6, 13, 14, 29, 31, 39, 64, 78, 50, 63, 61, 19
6, 13, 14, 29, 31, 39, 64, 78, 50, 63, 61, 19
6, 13, 14, 19, 29, 31, 39, 64, 78, 50, 63, 61
6, 13, 14, 19, 29, 31, 39, 64, 78, 50, 63, 61
6, 13, 14, 19, 29, 31, 39, 64, 78, 50, 63, 61
6, 13, 14, 19, 29, 31, 39, 50, 64, 78, 63, 61
6, 13, 14, 19, 29, 31, 39, 50, 61, 64, 78, 63
6, 13, 14, 19, 29, 31, 39, 50, 61, 63, 64, 78
6, 13, 14, 19, 29, 31, 39, 50, 61, 63, 64, 78
6, 13, 14, 19, 29, 31, 39, 50, 61, 63, 64, 78
6, 13, 14, 19, 29, 31, 39, 50, 61, 63, 64, 78

http://en.wikipedia.org/wiki/Selection_sort

Selection Sort Analysis

- Selection Sort (Input: list of n numbers)

```
for pos = 1 to n
```

```
    // find the smallest element in [pos, n]
```

```
    smallest = pos
```

```
    for check = pos+1 to n
```

```
        if (list[check] < list[smallest]): smallest = check
```

```
    // move the smallest element to the front
```

```
    tmp = list[smallest]
```

```
    list[pos] = list[smallest]
```

```
    list[smallest] = tmp
```

- Analysis

$$T = n + (n - 1) + (n - 2) + \dots + 3 + 2 + 1 = \sum_{i=1}^n i = \frac{n(n + 1)}{2} = O(n^2)$$

- Outer loop: pos = 1 to n

- Inner loop: check = pos to n

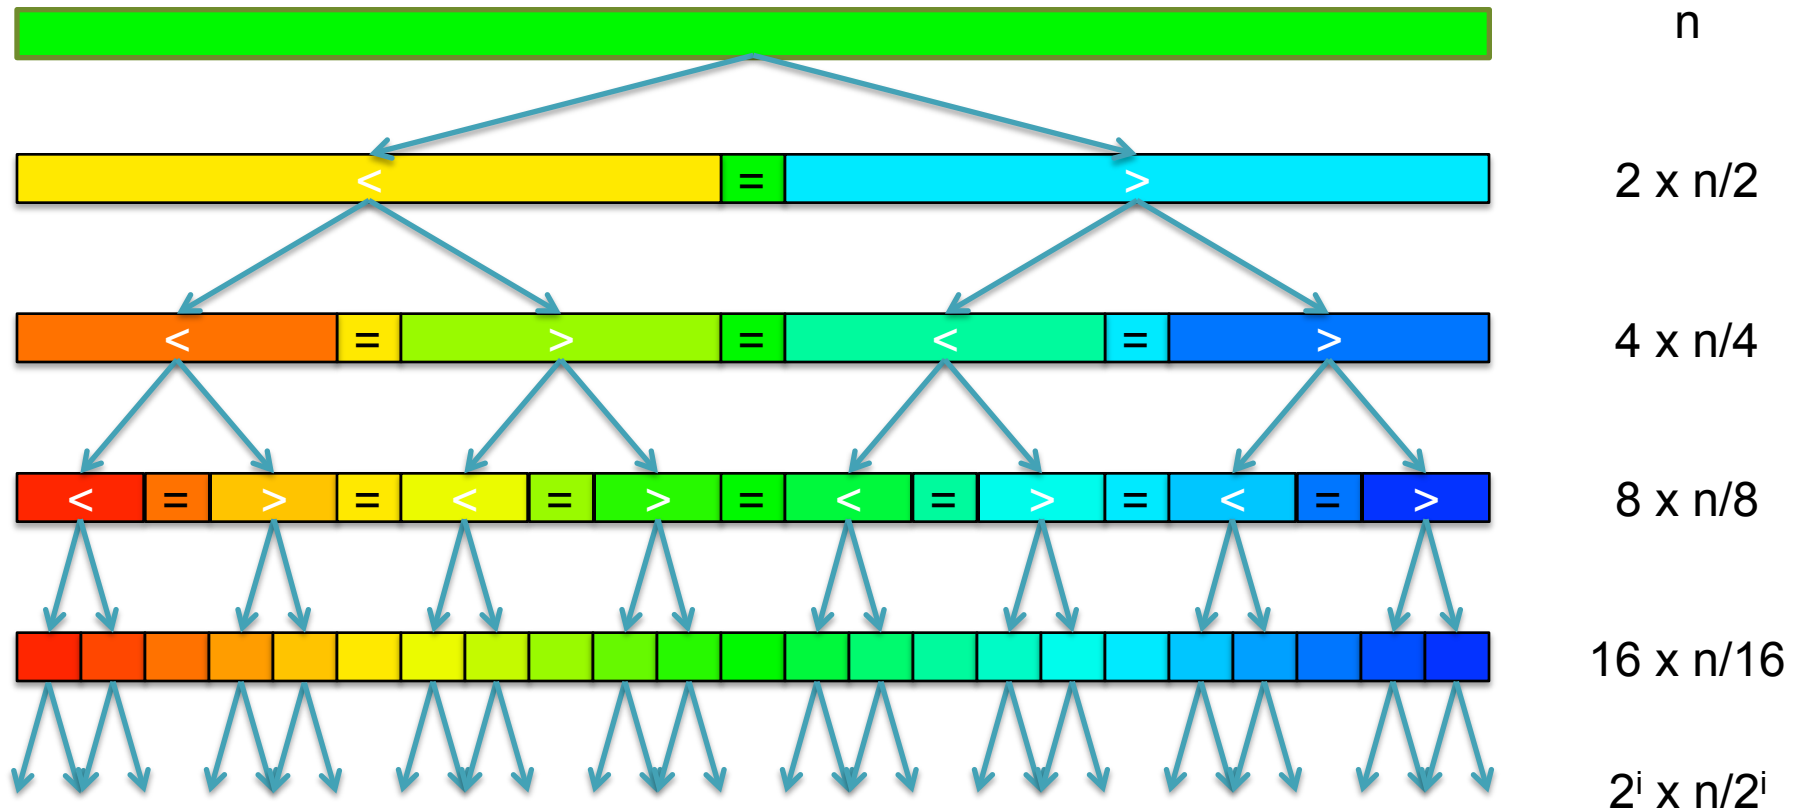

- Running time: Outer * Inner = $O(n^2)$

[9 Billion Billion]

[Challenge Questions: Why is this slow? / Can we sort any faster?]

Divide and Conquer

- Selection sort is slow because it rescans the entire list for each element
 - How can we split up the unsorted list into independent ranges?
 - Hint 1: Binary search splits up the problem into 2 independent ranges (hi/lo)
 - Hint 2: Assume we know the median value of a list

[How many times can we split a list in half?]

QuickSort Analysis

- QuickSort(Input: list of n numbers)

```
// see if we can quit
```

```
if (length(list) <= 1): return list
```

```
// split list into lo & hi
```

```
pivot = median(list)
```

```
lo = {}; hi = {};
```

```
for (i = 1 to length(list))
```

```
    if (list[i] < pivot): append(lo, list[i])
```

```
    else:                append(hi, list[i])
```

```
// recurse on sublists
```

```
return (append(QuickSort(lo), QuickSort(hi)))
```

- Analysis (Assume we can find the median in $O(n)$)

$$T(n) = \begin{cases} O(1) & \text{if } n \leq 1 \\ O(n) + 2T(n/2) & \text{else} \end{cases}$$

$$T(n) = n + 2\left(\frac{n}{2}\right) + 4\left(\frac{n}{4}\right) + \cdots + n\left(\frac{n}{n}\right) = \sum_{i=0}^{\lg(n)} \frac{2^i n}{2^i} = \sum_{i=0}^{\lg(n)} n = O(n \lg n) \quad [\sim 94B]$$

<http://en.wikipedia.org/wiki/Quicksort>

QuickSort Analysis

- QuickSort(Input: list of n numbers)
// see if we can quit
if (length(list) <= 1): return list

// split list into lo & hi
pivot = median(list)
lo = {}; hi = {};
for (i = 1 to length(list))
 if (list[i] < pivot): append(lo, list[i])
 else: append(hi, list[i])

// recurse on sublists
return (append(QuickSort(lo), QuickSort(hi)))

<http://en.wikipedia.org/wiki/Quicksort>

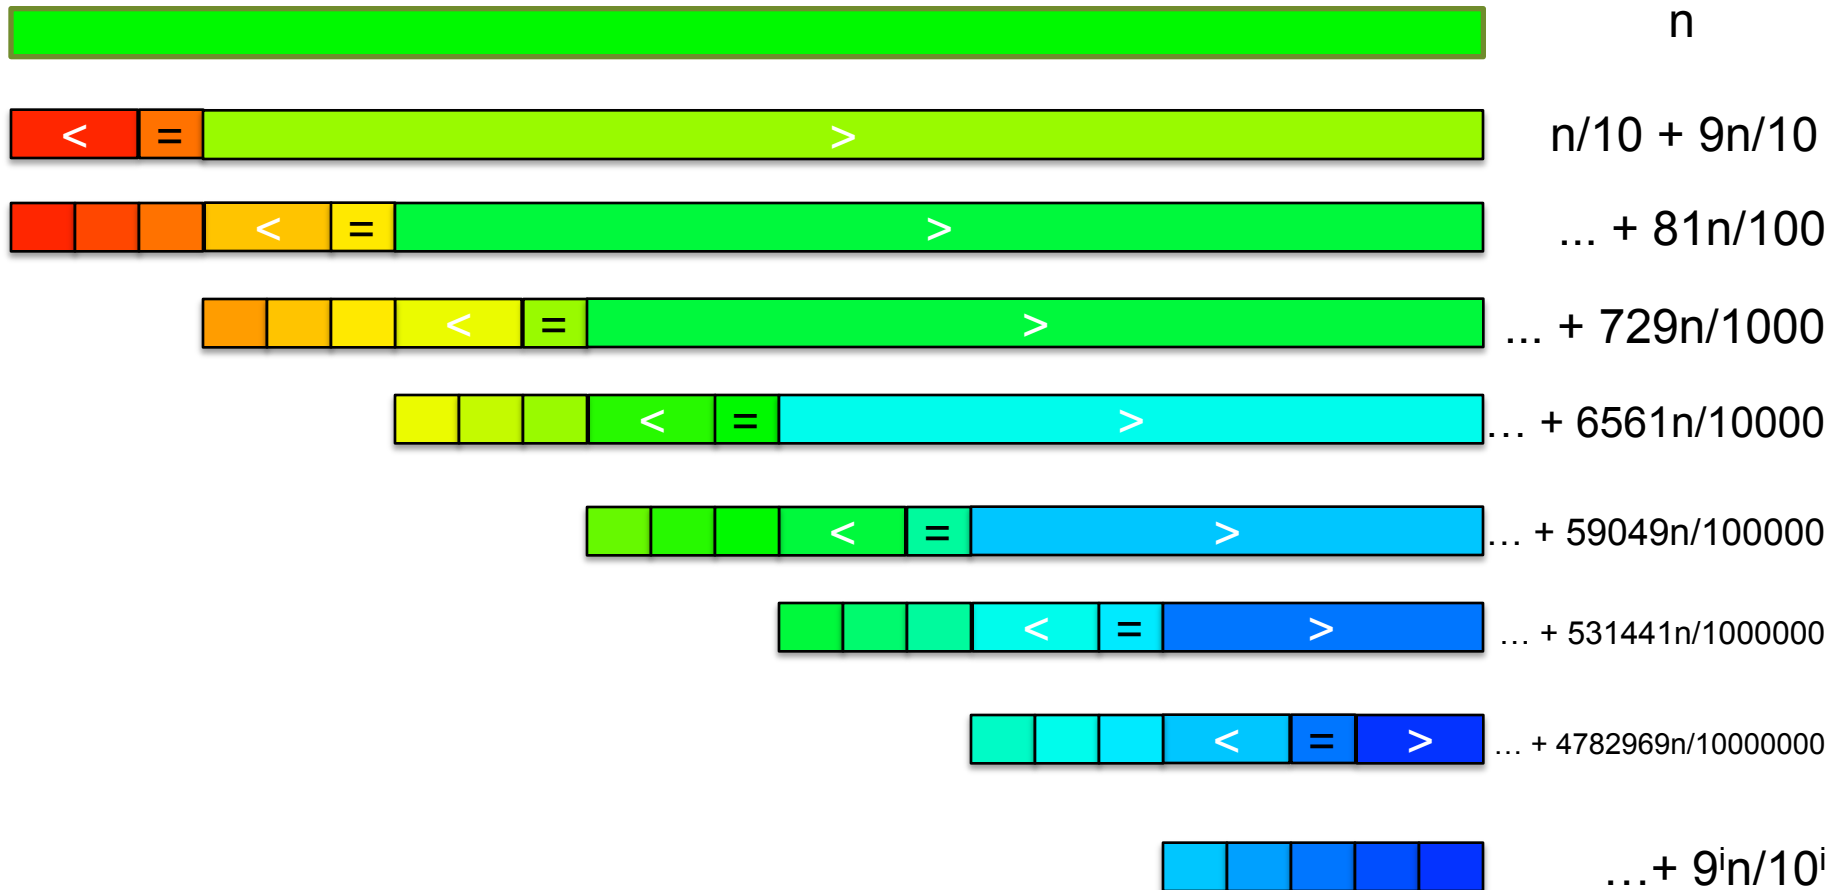

- Analysis (Assume we can find the median in $O(n)$)

$$T(n) = \begin{cases} O(1) & \text{if } n \leq 1 \\ O(n) + 2T(n/2) & \text{else} \end{cases}$$

$$T(n) = n + 2\left(\frac{n}{2}\right) + 4\left(\frac{n}{4}\right) + \cdots + n\left(\frac{n}{n}\right) = \sum_{i=0}^{\lg(n)} \frac{2^i n}{2^i} = \sum_{i=0}^{\lg(n)} n = O(n \lg n) \quad [\sim 94B]$$

Picking the Median

- What if we miss the median and do a 90/10 split instead?

[How many times can we cut 10% off a list?]

Randomized Quicksort

- **90/10 split runtime analysis**

Find smallest x s.t.

$$T(n) = n + T\left(\frac{n}{10}\right) + T\left(\frac{9n}{10}\right)$$

$$(9/10)^x n \leq 1$$

$$T(n) = n + \frac{n}{10} + T\left(\frac{n}{100}\right) + T\left(\frac{9n}{100}\right) + \frac{9n}{10} + T\left(\frac{9n}{100}\right) + T\left(\frac{81n}{100}\right)$$

$$(10/9)^x \geq n$$

$$T(n) = n + n + T\left(\frac{n}{100}\right) + 2T\left(\frac{9n}{100}\right) + T\left(\frac{81n}{100}\right)$$

$$x \geq \log_{10/9} n$$

$$T(n) = \sum_{i=0}^{\log_{10/9}(n)} n = O(n \lg n)$$

- **If we randomly pick a pivot, we will get at least a 90/10 split with very high probability**

- Everything is okay as long as we always slice off a fraction of the list

[Challenge Question: What happens if we slice 1 element]

QuickSort in Matlab

```
sort(seq)
```

- The goal of software engineering is to build libraries of correct reusable functions that implement higher level ideas
 - Build complex software out of simple components
 - Software tends to be 90% plumbing, 10% research
 - You still need to know how they work
 - Matlab requires an explicit representation of the strings

Break

Sorting in Linear Time

- Can we sort faster than $O(n \lg n)$?
 - No – Not if we have to compare elements to each other
 - Yes – But we have to 'cheat' and know the structure of the data

Sort these numbers into ascending order:

14, 29, 6, 31, 39, 64, 78, 50, 13, 63, 61, 19

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25
26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50
51	52	53	54	55	56	57	58	59	60	61	62	63	64	65	66	67	68	69	70	71	72	73	74	75

Sorting in Linear Time

- Can we sort faster than $O(n \lg n)$?
 - No – Not if we have to compare elements to each other
 - Yes – But we have to 'cheat' and know the structure of the data

Sort these numbers into ascending order:

14, 29, 6, 31, 39, 64, 78, 50, 13, 63, 61, 19

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25
26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50
51	52	53	54	55	56	57	58	59	60	61	62	63	64	65	66	67	68	69	70	71	72	73	74	75
76	77	78	79	80	81	82	83	84	85	86	87	88	89	90	91	92	93	94	95	96	97	98	99	100

Sorting in Linear Time

- Can we sort faster than $O(n \lg n)$?
 - No – Not if we have to compare elements to each other
 - Yes – But we have to 'cheat' and know the structure of the data

Sort these numbers into ascending order:

14, 29, 6, 31, 39, 64, 78, 50, 13, 63, 61, 19

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25

6,13,14,19,29,31,39,50,61,63,64,78

```
for(i = 1 to 100) { cnt[i] = 0; }
```

```
for(i = 1 to n) { cnt[list[i]]++; }
```

```
for(i = 1 to 100) { while (cnt[i] > 0){print i; cnt[i]--}}
```

[3B instead of 94B]

3. Suffix Trees

#	Sequence	Pos
1	ACAGATTACC...	6
2	ACC...	13
3	AGATTACC...	8
4	ATTACAGATTACC...	3
5	ATTACC...	10
6	C...	15
7	CAGATTACC...	7
8	CC...	14
9	GATTACAGATTACC...	2
10	GATTACC...	9
11	TACAGATTACC...	5
12	TACC...	12
13	TGATTACAGATTACC...	1
14	TTACAGATTACC...	4
15	TTACC...	11

- Suffix Tree = Tree of suffixes (indexes **all** substrings of a sequence)
 - 1 Leaf (\$) for each suffix, path-label to leaf spells the suffix
 - Nodes have at least 2 and at most 5 children (A,C,G,T,\$)

Suffix Trees Searching

- Look up a query by "walking" along the edges of the tree
 - GATTACA

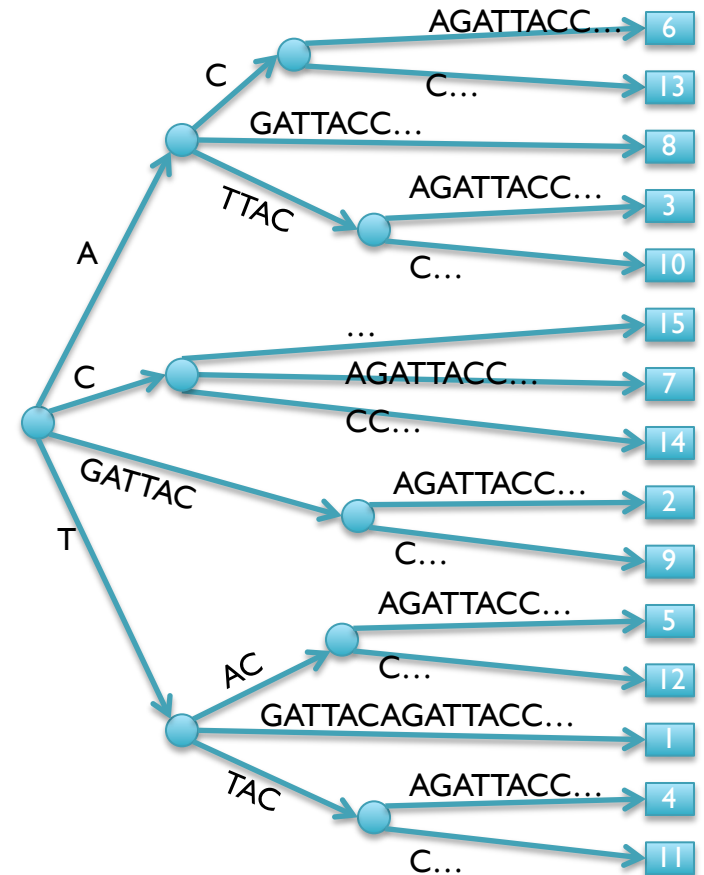

Suffix Trees Searching

- Look up a query by "walking" along the edges of the tree
 - GACTACA

Suffix Trees Searching

- Look up a query by "walking" along the edges of the tree
 - ATTAC

Suffix Trees Searching

- Look up a query by "walking" along the edges of the tree

- ATTAC
- Matches at 3 and 10

- Query Lookup in 2 phases:
 1. Walk along edges to find matches
 2. Walk subtree to find positions

DepthFirstPrint(Node cur)

if cur.isLeaf

 print cur.pos

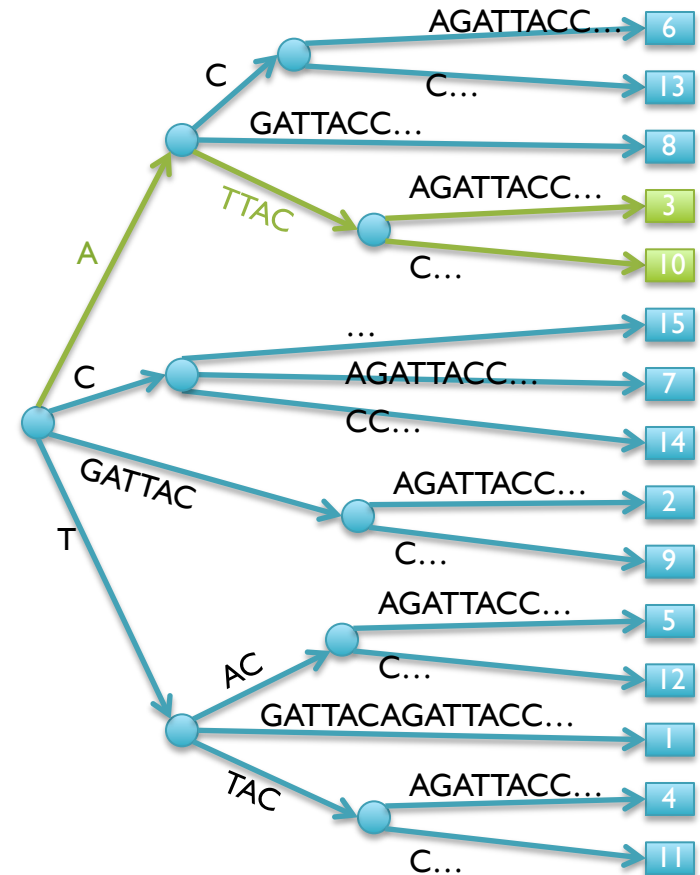

else

 foreach child in cur.children

 DepthFirstPrint(child)

[What is the running time of DFP

 => How many nodes does the tree have?]

Suffix Tree Properties & Applications

Properties

- Number of Nodes/Edges: $O(n)$
- Tree Size: $O(n)$
- Max Depth: $O(n)$
- Construction Time: $O(n)$
 - Uses suffix links to jump between nodes without rechecking
 - Tricky to implement, prove efficiency

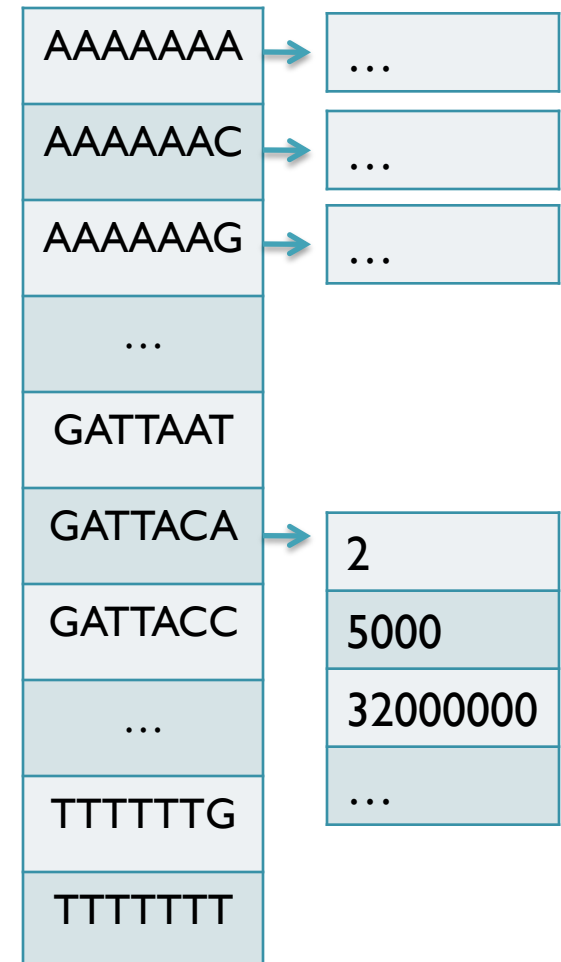

Applications

- Sorting all suffixes: $O(n)$
 - Check for query: $O(m)$
 - Find all z occurrences of a query $O(m + z)$
 - Find maximal exact matches $O(m)$
 - Longest common substring $O(m)$
- [HOW?]
- Used for many string algorithms in linear time
 - Many can be implemented on suffix arrays using a little extra work

4. Hashing

- Where is GATTACA in the human genome?
 - Build an inverted index (table) of every kmer in the genome
- How do we access the table?
 - We can only use numbers to index
 - `table[GATTACA] <- error, does not compute`
 - Encode sequences as numbers
 - Simple: A = 0, C = 1, G = 2, T = 3
 - GATTACA = 2 0 3 3 0 1 0
 - Smart: A = 00₂, C = 01₂, G = 10₂, T = 11₂
 - GATTACA = 10 00 11 11 00 01 00₂ = 9156₁₀
 - Running time
 - Construction: O(n)
 - Lookup: O(l) + O(z)
 - Sorts the genome mers in linear time

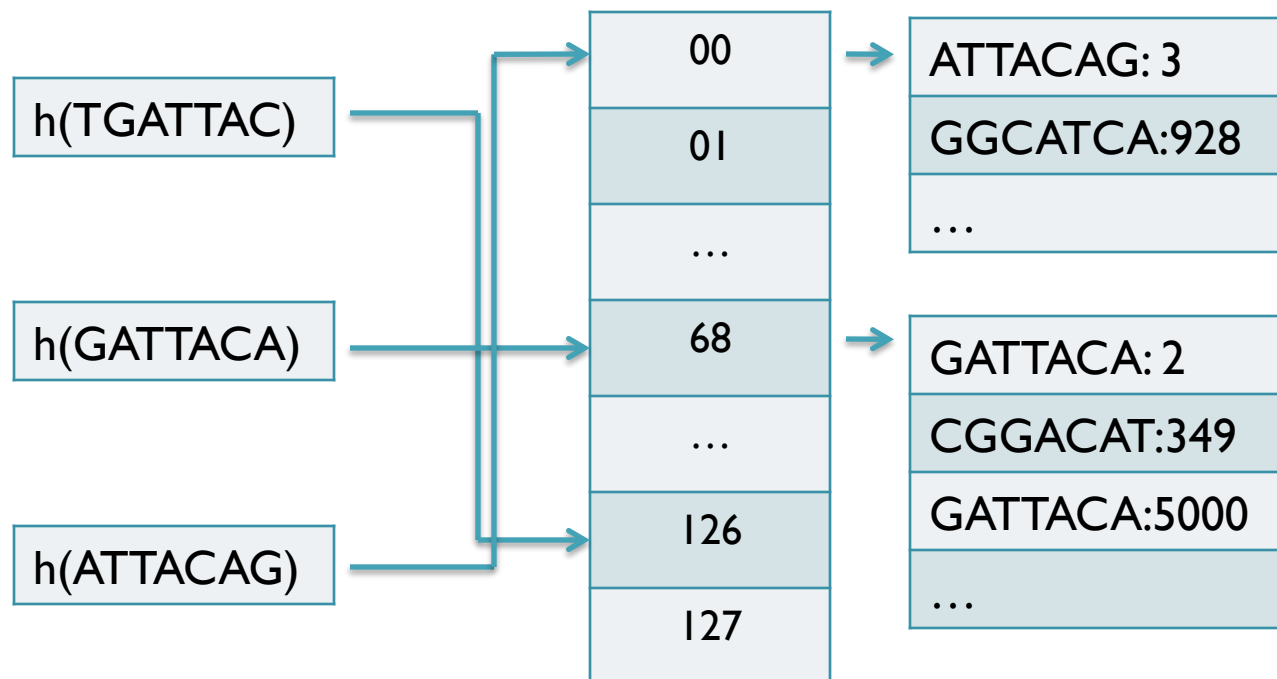

Hash Tables and Hash Functions

- Number of possible sequences of length $k = 4^k$
 - $4^7 = 16,384$ (easy to store)
 - $4^{20} = 1,099,511,627,776$ (impossible to directly store in RAM)
 - There are only 3B 20-mers in the genome
 - ⇒ Even if we could build this table, 99.7% will be empty
 - ⇒ But we don't know which cells are empty until we try
- Use a hash function to shrink the possible range
 - Maps a number n in $[0,R]$ to h in $[0,H]$
 - » Use 128 buckets instead of 16,384, or 10B instead of 1T
 - Division: $\text{hash}(n) = H * n / R$;
 - » $\text{hash}(\text{GATTACA}) = 128 * 9156 / 16384 = 71$
 - Modulo: $\text{hash}(n) = n \% H$
 - » $\text{hash}(\text{GATTACA}) = 9156 \% 128 = 68$

[Why would we want different functions?]

Hash Table Lookup

- By construction, multiple keys have the same hash value
 - Store elements with the same key in a bucket chained together
 - A good hash evenly distributes the values: R/H have the same hash value
 - Looking up a value scans the entire bucket
 - Slows down the search as a function of the hash table load
 - Warning: This complexity is usually hidden in the hash table code

[How many elements do we expect per bucket?]

Variable Length Queries

- Where are GATTACA and GATTACCA in the human genome?
 - $s = \min(\text{length of all queries})$
 - Build an inverted index of all s -mers (seeds) in the genome
 - GATTACA \Rightarrow 2, 5000, 32000000, ...
 - GATTACC \Rightarrow 5500, 10101, 1000000, ...
- Seed-and-extend to find end-to-end exact matches
 - Check every occurrence of the qry seed (first s characters)
 - ~ 1 in 4 are GATTACCA, 1 in 4 are GATTACCC, etc
 - The specificity of the seed depends on $\text{length}(q)$ & s
 - Works best if $\text{max}(\text{length}) \approx \text{min}(\text{length})$
 - Works best if $e\text{-value}(m)$ is $\ll 1$

Exact Matching Review

- E-value depends on length of genome and inversely on query length
 - $E = (n-m+1)/4^m$

Algorithms Summary

- Algorithms choreograph the dance of data inside the machine
 - Algorithms add provable precision to your method
 - A smarter algorithm can solve the same problem with much less work
- Techniques
 - Binary search: Fast lookup in any sorted list
 - Divide-and-conquer: Split a hard problem into an easier problem
 - Recursion: Solve a problem using a function of itself
 - Randomization: Avoid the demon
 - Hashing: Storing sets across a huge range of values
 - Indexing: Focus on the search on the important parts
 - Different indexing schemes have different space/time features
- Data Structures
 - Primitives: Integers, Numbers, Strings
 - Lists / Arrays / Multi-dimensional arrays
 - Trees
 - Hash Table
