Graphs and Genomes Michael Schatz

Bioinformatics Lecture 3 Undergraduate Research Program 2011

Recap

- Algorithms choreograph the dance of data inside the machine
 - Algorithms add provable precision to your method
 - A smarter algorithm can solve the same problem with much less work
- Techniques
 - Analysis: Characterize performance, correctness
 - Modeling: Characterize what you expect to see
 - Binary search: Fast lookup in any sorted list
 - Divide-and-conquer: Split a hard problem into an easier problem
 - Recursion: Solve a problem using a function of itself
 - Indexing: Focus on just the important parts
 - Seed-and-extend: Anchor the problem using a portion of it
 - Brute Force, Suffix Arrays, Binary Search, Quicksort, Bowtie

Challenge Question

Using Bowtie (bowtie -v 0 –a --norc) or your own implementation of the brute force algorithm, scan the E. coli K12/MG1655 genome for GATTACA:

http://schatzlab.cshl.edu/teaching/2011/Ecoli.fa http://schatzlab.cshl.edu/teaching/2011/GATTACA.fq

Compute the number of occurrences for each of the following queries, and the degree to which the empirical number of matches is consistent with the theoretical e-value. Point out any particularly significant deviations from the theoretical model.

Gattaca:	GATTACA
Gattaca ² :	GATTACAGATTACA
Gattaca ³ :	GATTACAGATTACAGATTACA
Start Codon:	ATG
Stop Codons:	TAG, TAA, TGA

Challenge Response

Sequence	Observed	Expected	Difference
GATTACA	230	283	-19%
GATTACA ²	0	0.01	-
GATTACA ³	0	0	-
Start: ATG	76238	72494	+5%
Stop:TAG	27243	72494	-62%
Stop:TAA	68838	72494	-5%
Stop:TGA	83491	72494	+14%

Received November 27, 1996; Revised and Accepted February 13, 1997

Outline

- I. Part I: Graphs
 - I. Genome Assembly by Analogy
 - 2. Graph Searching
- 2. Part 2: Schatz Lab
 - I. A little about me
 - 2. Projects

Shredded Book Reconstruction

Dickens accidentally shreds the first printing of <u>A Tale of Two Cities</u>
 – Text printed on 5 long spools

- How can he reconstruct the text?
 - 5 copies x 138, 656 words / 5 words per fragment = 138k fragments
 - The short fragments from every copy are mixed together
 - Some fragments are identical

Greedy Reconstruction

The repeated sequence make the correct reconstruction ambiguous

• It was the best of times, it was the [worst/age]

Model sequence reconstruction as a graph problem.

de Bruijn Graph Construction

- $D_k = (V, E)$
 - V = All length-k subfragments (k < l)
 - E = Directed edges between consecutive subfragments
 - Nodes overlap by k-1 words

- Locally constructed graph reveals the global sequence structure
 - Overlaps between sequences implicitly computed

de Bruijn, 1946 Idury and Waterman, 1995 Pevzner, Tang, Waterman, 2001

de Bruijn Graph Assembly

de Bruijn Graph Assembly

Biological Networks

Figure 5 Putative regulatory elements shared between groups of correlated and anticorrelated genes

- Nodes
 - People, Proteins, Genes, Neurons, Sequences, Numbers, ...
- Edges
 - A is connected to B
 - A is related to B
 - A regulates B
 - A precedes B
 - A interacts with B
 - A activates B

- ...

Graph Types

Kevin Bacon and Bipartite Graphs

BFS and **TSP**

- BFS computes the shortest path between a pair of nodes in $O(|E|) = O(|N|^2)$
- What if we wanted to compute the shortest path visiting every node once?
 - Traveling Salesman Problem

Greedy Search

Greedy Search

cur=graph.randNode()
while (!done)
next=cur.getNextClosest()

Greedy: ABDCA = 10+10+50+11= 81

Optimal: ACBDA = 11 + 11 + 10 + 11 = 43

Greedy finds the global optimum only when

- I. Greedy Choice: Local is correct without reconsideration
- 2. Optimal Substructure: Problem can be split into subproblems

Optimal Greedy: Making change with the fewest number of coins

TSP Complexity

- No fast solution
 - Knowing optimal tour through n cities doesn't seem to help much for n+1 cities

[How many possible tours for n cities?]

- Extensive searching is the only provably correct algorithm
 - Brute Force: O(n!)
 - ~20 cities max
 - 20! = 2.4×10^{18}

Branch-and-Bound

- Abort on suboptimal solutions as soon as possible
 - ADBECA = 1+2+2+2+3 = 10
 - ABDE = 4+2+30 > 10
 - ADE = |+30 > |0|
 - AED = I + 30 > 10

— …

- Performance Heuristic
 - Always gives the optimal answer
 - Doesn't always help performance, but often does
 - Current TSP record holder:
 - 85,900 cities
 - 85900! = 10^{386526}

[When not?]

TSP and NP-complete

- TSP is one of many extremely hard problems of the class NP-complete
 - Extensive searching is the only way to find an exact solution
 - Often have to settle for approx. solution

- WARNING: Many biological problems are in this class
 - Find a tour the visits every node once (Genome Assembly)
 - Find the smallest set of vertices covering the edges (Essential Genes)
 - Find the largest clique in the graph (Protein Complexes)
 - Find the highest mutual information encoding scheme (Neurobiology)
 - Find the best set of moves in tetris
 - ...
 - http://en.wikipedia.org/wiki/List_of_NP-complete_problems

A Little About Me

Sequencing Applications

Phylogeny & Evolution

The DNA Data Race

Year	Genome	Technology	Cost
2001	Venter et al.	Sanger (ABI)	\$300,000,000
2007	Levy et al.	Sanger (ABI)	\$10,000,000
2008	Wheeler et al.	Roche (454)	\$2,000,000
2008	Ley et al.	Illumina	\$1,000,000
2008	Bentley et al.	Illumina	\$250,000
2009	Pushkarev et al.	Helicos	\$48,000
2009	Drmanac et al.	Complete Genomics	\$4,400

(Pushkarev et al., 2009)

Sequencing a single human genome uses ~100 GB of compressed sequence data in billions of short reads. ~20 DVDs / genome

Sequencing Centers

Next Generation Genomics: World Map of High-throughput Sequencers

http://pathogenomics.bham.ac.uk/hts/

The DNA Data Tsunami

Current world-wide sequencing capacity exceeds 33Tbp/day (12Pbp/year) and is growing at 5x per year!

"Will Computers Crash Genomics?" Elizabeth Pennisi (2011) Science. 331(6018): 666-668.

Use massive amounts of sequencing to explore the genetic origins of life

Our best (only) hope is to use many computers:

- Parallel Computing aka Cloud Computing
- Now your programs will crash on 1000 computers instead of just 1 ⁽²⁾

Hadoop MapReduce

http://hadoop.apache.org

- MapReduce is Google's framework for large data computations
 - Data and computations are spread over thousands of computers
 - Indexing the Internet, PageRank, Machine Learning, etc... (Dean and Ghemawat, 2004)
 - 946 PB processed in May 2010 (Jeff Dean at Stanford, 11.10.2010)
 - Hadoop is the leading open source implementation
 - Developed and used by Yahoo, Facebook, Twitter, Amazon, etc
 - GATK is an alternative implementation specifically for NGS
 - Benefits
 - Scalable, Efficient, Reliable
 - Easy to Program
 - Runs on commodity computers

- Challenges
 - Redesigning / Retooling applications
 - Not Condor, Not MPI
 - Everything in MapReduce

Parallel Algorithm Spectrum

Embarrassingly Parallel

Map-only Each item is Independent

Loosely Coupled

MapReduce Independent-Sync-Independent

Tightly Coupled

Iterative MapReduce Constant Sync

• Given a reference and many subject reads, report one or more "good" end-toend alignments per alignable read

Methyl-Seq

Hi-C-Seq

- Find where the read most likely originated
- Fundamental computation for many assays
 - Genotyping
 RNA-Seq
 - Structural Variations Chip-Seq
- Desperate need for scalable solutions
 - Single human requires >1,000 CPU hours / genome

http://bowtie-bio.sourceforge.net/crossbow

- Align billions of reads and find SNPs
 - Reuse software components: Hadoop Streaming
- Map: Bowtie (Langmead et al., 2009)
 - Find best alignment for each read
 - Emit (chromosome region, alignment)
- Shuffle: Hadoop
 - Group and sort alignments by region
- Reduce: SOAPsnp (Li et al., 2009)
 - Scan alignments for divergent columns
 - Accounts for sequencing error, known SNPs

Performance in Amazon EC2

http://bowtie-bio.sourceforge.net/crossbow

	Asian Individual Genome			
Data Loading	3.3 B reads	106.5 GB	\$10.65	
Data Transfer	lh:15m	40 cores	\$3.40	
Setup	0h : I 5m	320 cores	\$13.94	
Alignment	Ih : 30m	320 cores	\$41.82	
Variant Calling	I h : 00m	320 cores	\$27.88	
End-to-end	4h : 00m		\$97.69	

Discovered 3.7M SNPs in one human genome for ~\$100 in an afternoon. Accuracy validated at >99%

Searching for SNPs with Cloud Computing.

Map-Shuffle-Scan for Genomics

Schatz, MC, Langmead B, Salzberg SL (2010) Nature Biotechnology. 28:691-693

Short Read Assembly

- Genome assembly as finding an Eulerian tour of the de Bruijn graph
 Human genome: >3B nodes, >10B edges
- The new short read assemblers require tremendous computation
 - Velvet (Zerbino & Birney, 2008) serial: > 2TB of RAM
 - ABySS (Simpson et al., 2009) MPI: 168 cores x ~96 hours
 - SOAPdenovo (Li et al., 2010) pthreads: 40 cores x 40 hours, >140 GB RAM

Graph Compression

- After construction, many edges are unambiguous
 - Merge together compressible nodes
 - Graph physically distributed over hundreds of computers

Warmup Exercise

• Who here was born closest to July 8?

- You can only compare to I other person at a time

Find winner among 64 teams in just 6 rounds

Fast Path Compression

Challenges

- Nodes stored on different computers
- Nodes can only access direct neighbors

Randomized List Ranking

- Randomly assign H/T to each compressible node
- Compress (Ĥ)→T links

Initial Graph: 42 nodes

Randomized Speed-ups in Parallel Computation. Vishkin U. (1984) ACM Symposium on Theory of Computation. 230-239.
Challenges

- Nodes stored on different computers
- Nodes can only access direct neighbors

Randomized List Ranking

- Randomly assign (H)/ T to each compressible node
- Compress $(H) \rightarrow T$ links

Round 1: 26 nodes (38% savings)

Challenges

- Nodes stored on different computers
- Nodes can only access direct neighbors

Randomized List Ranking

- Randomly assign (H)/ T to each compressible node
- Compress $(H) \rightarrow T$ links

Round 2: 15 nodes (64% savings)

Challenges

- Nodes stored on different computers
- Nodes can only access direct neighbors

Randomized List Ranking

- Randomly assign (H) / T to each compressible node
- Compress $(H) \rightarrow T$ links

Round 2: 8 nodes (81% savings)

Challenges

- Nodes stored on different computers
- Nodes can only access direct neighbors

Randomized List Ranking

- Randomly assign (H) / T to each compressible node
- Compress $(H) \rightarrow T$ links

Round 3: 6 nodes (86% savings)

Challenges

- Nodes stored on different computers
- Nodes can only access direct neighbors

Randomized List Ranking

- Randomly assign (H) / T to each compressible node
- Compress (Ĥ)→T links

Performance

- Compress all chains in log(S) rounds

Round 4: 5 nodes (88% savings)

Randomized Speed-ups in Parallel Computation.

Vishkin U. (1984) ACM Symposium on Theory of Computation. 230-239.

Contrail

http://contrail-bio.sourceforge.net

De novo bacterial assembly

- Genome: E. coli K12 MG1655, 4.6Mbp
- Input: 20.8M 36bp reads, 200bp insert (~150x coverage)
- Preprocessor: Quake Error Correction

Assembly of Large Genomes with Cloud Computing.

Schatz MC, Sommer D, Kelley D, Pop M, et al. In Preparation.

Contrail http://contrail-bio.sourceforge.net

De novo Assembly of the Human Genome

- Genome: African male NA18507 (SRA000271, Bentley et al., 2008)
- Input: 3.5B 36bp reads, 210bp insert (~40x coverage)

Assembly of Large Genomes with Cloud Computing.

Schatz MC, Sommer D, Kelley D, Pop M, et al. In Preparation.

De novo mutations and de Bruijn Graphs

 Look for sequence paths unique to affected child

COLEC12 C->A

Illumina/PacBio Hybrid Assembly

Find long reads that align well to the ends of the contigs/scaffolds

- Require >80% sequence identity
- Require <100bp overhang
- Require >1 read spans gap

Require >50bp match length Require >-50bp gap span Require >500bp contig length

Yeast

151 linked scaffold pairs Gap sizes: 289 +/- 270bp Max Gap: 1582bp

Scaffold N50: 125kbp (+54%) Scaffolds >500bp: 242 (-36%) Scaffolds >1kbp : 210 (-28%)

Rice

14890 linked scaffold pairs Gap sizes: 240.5 +/- 269.4 Max Gap: 2680bp

Scaffold N50: ----(4000 CPU hours until failure)

Structural Variations in Cancer

Use short reads to discover large scale variations

 Discordant Pairs Analysis with Hydra (Quinlan et al. 2010)

Circos plot of high confidence SVs¹⁵ specific to esophageal cancer sample

- Red: SV links
- Orange: 375 cancer genes
- Blue: 4950 disease genes

Detailed analysis of disrupted genes and fusion genes in progress

MicroSeq: NextGen Microsatellite Profiling

Mitchell Bekritsky, WSBS

- Class of simple sequence repeats
 - $\dots GCACACACACAT \dots = \dots G(CA)_5T \dots$
 - Created and mutate primarily through slippage during replication
 - Highly variable & ubiquitous
- Genotyping with SeqMS
 - Rapidly detect MS sequences
 - Map reads using a new MS-mapper
 - Analyze profiles in cells, across cells, & across populations
 - Loss of heterozygosity
 - Development of somatic & cancer cells
 - Relations across strains, across species
 - etc...

Summary

- We are witnessing the dawn of the digital age of biology
 - Next generation sequencing, microarrays, mass spectrometry, microscopy, ecology, etc
- Modern biology requires (is) quantitative biology
 - Computational, mathematical, and statistical techniques applied to analyze, integrate, and interpret biological sensor data
- Don't let the data tsunami crash on you
 - Study, practice, collaborate with quantitative techniques
